

# The Weakest Link: How Security Awareness Reduces Your Cyber Risk.

**Despite sophisticated technical measures, humans remain the weakest link in the fight against cyber threats. Cybercriminals have long since discovered fake emails, social engineering, and phishing as reliable sources of income. No organization is too small or person too insignificant to become a potential target. Train your employees now to fight cyber threats and prevent serious damage.**

In most cybersecurity incidents, people are either the primary cause or at least involved. As a result, technical and organizational measures are no longer sufficient to adequately protect the organization from cybercrime.

Employees often do not know how to deal with the ever-changing threats on the Internet. They may remember that they shouldn't click on every link. But how do they recognize fake emails, links and websites, or other sophisticated scams? How do you get employees to use really strong passwords?

## Increase the awareness and ability of your employees to deal with cyber threats

Cyberattacks are becoming increasingly sophisticated. Today, one wrong click can be catastrophic for an organization. Many employees feel too safe and underestimate the dangers of their personal online behavior, or they think that IT security is solely the responsibility of the IT department. This is where our training comes in.

We make cybersecurity accessible to everyone. We teach how to recognize dangers and create a lasting awareness of the potential pitfalls of digital business. Our courses show your employees how to work together to protect what really matters: Your company's data, intellectual property, reputation, and future. Prevent serious security incidents and train your employees to fight cyber threats.
